

## 1. VoiceOver and keyboard support for self-view in meetings

Now, you can control the self-view window during meetings using the VoiceOver screen reader or keyboard commands.

Keyboard users can use the **F6** key to focus on the self-view window. Once there, they use the tab key to navigate within the window and arrow keys to move the self-view across the screen. When sharing, use **Shift+Com+Con+S** as a shortcut to move between all the floating windows including self-view window.

For more information see the [Webex Meetings, Webex Webinars, and Webex Events \(classic\) accessibility features](#).

## 2. Automatic highlights and chapters for vidcasts

Vidcasts automatically generate summaries going over the key highlights of your vidcast. Instead of always needing to watch the entirety of a vidcast, you can now play or scroll through the highlights provided.

## 3. Automatic chapters generation

Vidcasts automatically generates chapters based on the content of your video.

## 4. Playlists

Collections in vidcasts are now called playlists. Playlists help you better organize your videos, and offer sequential playback.

## **5. Enhanced sharing**

Allows you to share videos to a Webex space while only granting those in the space access to view.

## **6. New Vidcast desktop app**

This acts as a helper app to record your Vidcasts. While recording, you can move and resize vidcasts for desktop, switch between self-view and screen view, and also use floating controls.
